Re: RANJITH GOPALAN

Dear Officer:

I offer this letter to detail the conditions of the direct, full-time, 40 hour per week employment of **RANJITH GOPALAN** in conjunction with Cognizant's H-1B petition filing.

Work Activities

Mr. **RANJITH GOPALAN** work activities will include:

	Job Duties	Percentage of Time
1	As a Solution Architect, he leads the AI Solutions Transformation initiative providing technical solutions and setting up a holistic framework for AI-driven and agentic life cycle automation in American International Group (AIG). Understand and analyse business, functional, technical and UI (User Interface) requirements by interacting with client stakeholders for the project/release working in Agile model. Participate in AI solution architecture requirement analysis, planning, environment provisioning, design of multi-agent orchestrated flows, prompt engineering, vector database design using PG Vector, preparation of requirement traceability matrix, model evaluation reports, hallucination detection metrics, and Human-in-the-Loop feedback matrix. Liaise between business and technical personnel to ensure mutual understanding of process and applications. Gathering and analysing business and functional requirements establishes the framework for each phase of the AI solution development lifecycle, and a miss could affect the entire customized AI solution by failing to ensure compliance with priorities, sequencing of tasks, or proper coding, prompt design and agent orchestration standards for the requirements. He uses the Claude Agent SDK and Claude Code CLI to create solution designs based on business requirements and to generate production-ready code on the fly using Generative AI. As the centrepiece of this initiative, he architects the AIG Centralized Agentic Platform on the AWS Agent Core framework — consumed programmatically through AWS Boto3 — and designs every agent in the platform using the Claude Code SDK pattern of Commands,	20

	Skills, Agents and Hooks, so that each CIO organization within AIG can pick and place these reusable agents into their own delivery pipelines, with full Jenkins integration into the enterprise CI/CD pipeline. He also develops and maintains agentic frameworks for API development and testing using Python Fast API and orchestrates APIs and agent-based flows for the Policy life cycle of Home / Excess Liability / Commercial lines.	
2	He leads Data Science / Generative AI and Agentic AI initiatives implementation in insurance business intelligence through quantitative and qualitative analysis. Understand business scenarios of the AI-Powered Application Suite as per the feature/requirement provided by the business in American International Group (AIG) for the respective releases. Analyse business functions and probability of optimization to bring customer delight on insurance products especially Line of Business like Home, Auto, Excess Liability and Commercial Underwriting. Analyse data from policy administration systems, Global Data Warehouse, document repositories, and underwriting platforms for different business transactions. Leverage a combination of complex data lookups, Retrieval-Augmented Generation (RAG) patterns, agentic orchestrated workflows, and state of the art Large Language Models to identify risk patterns and fraudulent transactions. Analyse data and identify patterns and forecast the potential outcome of certain actions and behaviours. For example, an underwriter who works for AIG could use the Underwrite Companion AI assistant — backed by an agentic orchestrated flow of retrieval, classification, hallucination-check and human-in-the-loop agents — to perform a risk appraisal for a specific commercial account based on submission history and loss runs. This is to calculate the gross and net premium and to issue a policy for that account. Bringing Linear / Nonlinear regression, classification models, and Deep Learning together with Generative AI using Python, AWS Bedrock (Claude/Titan), Lang Graph and PG Vector, he optimizes business solutions to improve insurance products across underwriting, claims and policy life cycle.	20
3	He manages delivery of release/hotfix with offshore team to ensure development engineering and production release going on time with optimized standard of AI architecture and development process. He is responsible for coordinating offshore team for understanding and resolving all the technical and non-technical queries raised by the offshore team on AI/ML pipelines, LLM integrations, and full-stack development tracks. He is involved in weekly status report and monthly status report presentation with clients on a timely basis. He is responsible for implementing industry leading practices and methodologies within AI engineering and solution architecture to improve the quality, efficiency and time to market. Leveraging expertise, tools & frameworks in the areas of Generative AI, RAG, multi-agent orchestration, and cloud-native deployment, providing highly skilled and dependable architects and developers with deep functional and technical expertise to continually achieve higher levels of delivery excellence.	20
4	As part of the Cognizant Software Engineering Group, he coordinates and conducts demos with Client leadership on the latest AI tools and solution accelerators including Code Impact Analyzer, Regression Optimizer, Biz Defect Predictor and Defect Triage Bot. He actively supports key Request	15

	for Proposal (RFP) responses for AIG, particularly in the areas of Legacy Modernization and the AIG Centralized Agentic Platform — contributing solution architecture, agentic orchestration design, estimation, technology stack selection, and reusable accelerator strategy, and presenting these proposed solutions directly to AIG Leadership for review, alignment and approval. He conducts periodic training programs for AIG Full-Time associates and Cognizant Full-Time associates on Predictive AI (Machine Learning and Deep Learning), Generative AI (Transformer architectures and Large Language Models), and Agentic Workflow implementation patterns including the Claude Code SDK (Commands, Hooks, Agents, Skills) and the AWS Agent Core framework. These training sessions ensure that a sufficient talent pool with deep AI expertise is continually available within both organizations to take up new AI-led opportunities and to scale Generative AI and Agentic AI adoption across AIG's lines of business.	
5	He is leading continuous integration and continuous deployment (CI/CD) for AI-powered applications in American International Group (AIG) by using tool sequence Git – Jenkins – Electric Flow – OpenShift and deploys applications to Docker containers specific to Production / lower environments, including Full-Stack Docker Compose deployment. He is part of analysing CI/CD issues and ensuring smooth flow of integration and deployment process which contains managing execution of Jenkins infrastructure through AWS – ECS Docker containers, AWS Fargate and AWS Lambda services. He is managing team to ensure that code developed under BDD is validating AI features during code He is also supporting Cognizant's initiative on CI/CD implementation by using tool sequence Git – Jenkins – Electric Flow – OpenShift in AWS environment to showcase capability presentations to ensure design-to-deployment is completed in AWS infrastructure on a scalable way using ECS / EKS / AWS Fargate / AWS Lambda services.	15
6	He is responsible and part of requirement grooming, planning meeting and Sprint planning meeting for implementing AI related feature in the different portfolio. He leads solution discussion for AI architecture development, end-to-end integration and enterprise data management. He works closely with business stake holders for providing solutioning for the business requirements and development of application code base through Behaviour Driven Development (BDD) approach, so that the code base of the respective stories/tasks will be validated before continuous integration. He is sharing the responsibility of application end-to-end development and ensuring that AI features — including LLM workflows, agent orchestration and RAG retrieval — are developed / validated in lower environments and deployed successfully in production and disaster recovery environments.	10

As detailed above, **RANJITH GOPALAN** will use advanced methods related to the Cognizant position, and the Cognizant position requires at minimum a Bachelor's degree in a field of study that is directly related to position to successfully perform the job duties.

Selection of Employees and Control of Work

At all times, Cognizant remains the sole and direct employer of our talent, and has control over the work of its employees. It is Cognizant that selects which of its employees will conduct work activities, determines what activities those employees will perform, and supervises and controls the work of those employees. Cognizant is responsible for paying salaries, benefits, and expenses for its employees. In the course of controlling the work activities of employees, Cognizant managers use a multitude of communication media and tools to supervise and control the work of our employees, including in-person or via video conferencing, desktop video, VoIP, mobile phones, instant messaging tools as well as through Cognizant's systems and tools.

Performance Reviews

The Performance Management Process at Cognizant is a structured, formal interaction between an employee and his or her manager. This process includes evaluating performance against set objectives and competencies applicable for that role, providing performance feedback, identifying development needs, and setting goals for the future. This on-going performance communication takes place between the employee and that employee's manager, which results in a performance rating for the employee. The objective of the Performance Management Process is to fuel the success of Cognizant and its employees.

Please feel free to contact me for additional information. Thank you.

Sincerely,

Abir Chatterjee

Sr. Director
